An active-ground that fits into the light plan of Part-Dieu (Lyon, France)

Lighting design of the building Silex1, consisting of two large and bright frames on eastside and westside and an active ground floor. This base suits to the urban plan of the district and in particular to the Lighting Plan, it accompanies the line Length of buildings. This nighttime active ground floor presence translates the nocturnal activity of the neighborhood. The shops lights play this role in a temporality respecting extinction between 01:00 and

07:00. To maintain a nightly presence of this ground floor, an integrated low-power standby lighting in the indoor architecture can continue to exist within the volume of the shops. Les éclairieurs also design the lighting of the skyscraper building next door, Silex2.
